

## Toxicology

A special contribution from the American Association of Poison Control Centers.

# 1983 Annual Report of the American Association of Poison Control Centers National Data Collection System

JOSEPH C. VELTRI, PharmD, TOBY L. LITOVITZ, MD

Since the inception of the first poison center in 1953, numerous obstacles to data collection have delayed the creation of a meaningful database of human poison exposures. Historically, the effort to develop a coordinated national poison exposure database began in 1957 when the United States Surgeon General created the National Clearinghouse for Poison Control Centers (NCPCC). The mandate of this Public Health Service agency included coordinating the flow of information among the existing 17 poison control centers, and a mechanism whereby these centers could share their experience—a data collection system—was implemented.

Unfortunately, neither regulatory power nor funding capability was integrated in the new plan, and the NCPCC obtained poison center cooperation voluntarily by offering data collection services at no direct cost to the participating centers. In the early years of

this system a standard case data form was supplied by NCPCC to the centers, completed by poison center staff, and returned to NCPCC for hand tabulation. The system became semi-automated in the early 1960s simultaneously with the rapid proliferation of poison control centers nationally.

The number of poison control centers increased from 17 centers in 1957 to over 600 sites by the mid-1960s, yet no organizational structure or network emerged. The centers developed without common objectives, standards, or data collection techniques. During this period the NCPCC continued to collect, computerize, and publish data from reporting poison control centers. However, data collation was not timely, the usual lag being 18 to 24 months. Furthermore, medical record-keeping was limited to a 3" × 8.5" card with an attached lightweight carbon copy to be retained by the poison center. (The original record was returned to the NCPCC.) Approximately 150,000 poison exposures were reported annually, collected from 150 to 400 reporting sites, which were predominantly small emergency department-based operations.

As regionalization of poison control services began in the early 1970s, the NCPCC data collection system became clearly inadequate. The small size of the existing form prevented adequate medical documentation of poison exposures, the data collected failed to address local issues of poison center accountability, and the data processing turnaround time was excessive. Consequently, the emerging large, high-quality regional poison centers began to develop autonomous data collection systems lacking uniformity of definitions and analysis. Noting the diversion of this large number of cases (each of these regional centers recorded 20,000 to 70,000 poison exposures each year), there existed a fair degree of uncertainty regarding the representativeness of the NCPCC data. Thus, uncer-

---

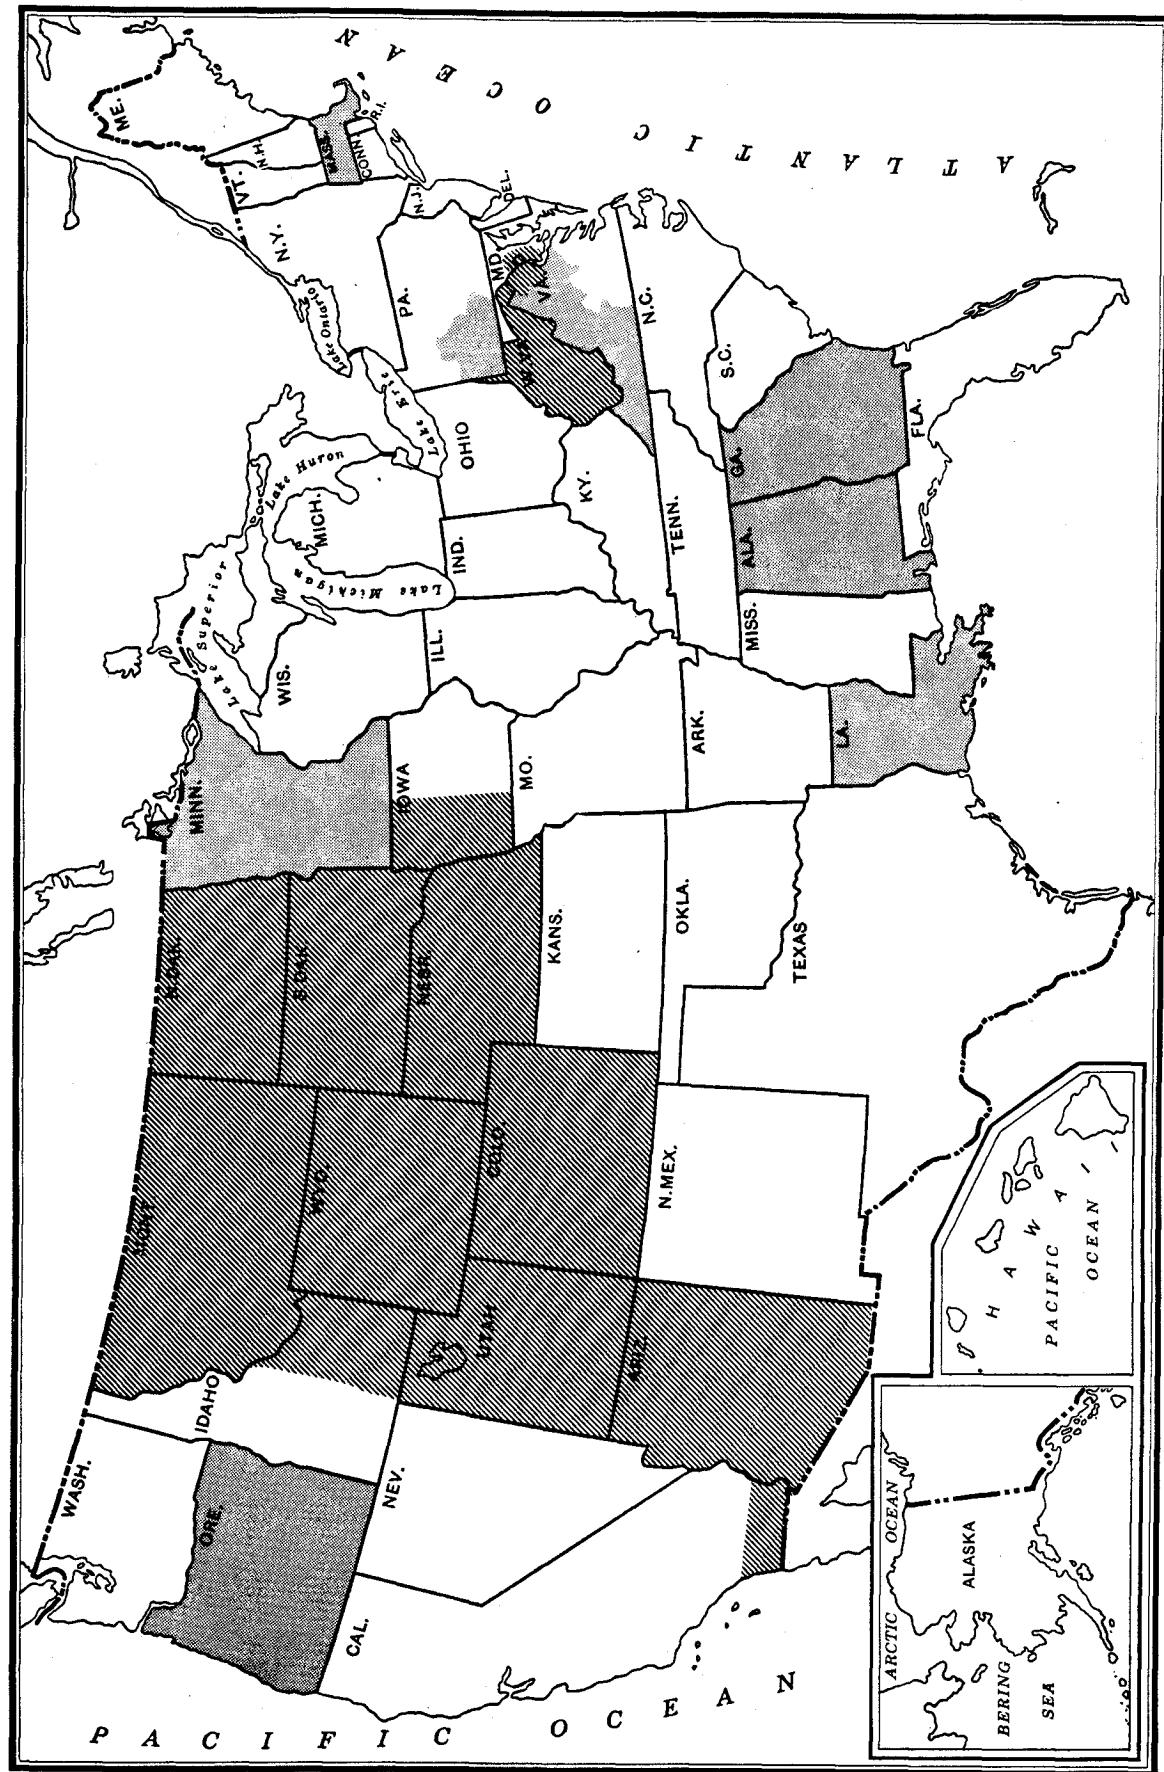

From the Data Collection Committee, American Association of Poison Control Centers.

Centers (and on-site coordinators) participating for the pilot year include the Arizona Poison Control System (Lory Fischler), Intermountain Regional Poison Control Center (William Adkins, RPh), Mid-Plains Poison Control Center (Lora Lea Brennan, RN), National Capital Poison Center (Toby Litovitz, MD), Rocky Mountain Poison Center (Kathy Wruk, RN), and San Diego Regional Poison Control Center (Anthony Manoguerra, Pharm D).

This is an official statement of the American Association of Poison Control Centers, which gratefully acknowledges the support of the Poison Surveillance and Epidemiology Branch of the Food and Drug Administration, the Drackett Company, the American Petroleum Institute, and McNeil Consumer Products Company in the development of this data collection system.

Address reprint requests to Dr. Litovitz: National Capital Poison Center, Georgetown University Hospital, 3800 Reservoir Rd. N.W., Washington, DC 20007.

**Key Words:** Poisoning, toxicology.

**FIGURE 1.** Sixteen poison centers participated in the data collection system for varying periods. The lightly stippled areas represent regions served by poison centers reporting data during a portion of 1983. Cross-hatched areas denote reporting during the entire year. (Map adapted from Hammond's Outline Map of the United States.)

tainty persisted regarding the magnitude or severity of poisoning problems within the general population.

During the late 1970s the American Association of Poison Control Centers (AAPCC) recognized the need to improve techniques of poison center data collection and reporting to develop a better analysis of patient experience. A data collection committee set out to develop a system capable of providing a uniform database with intercenter compatibility while simultaneously remaining sufficiently unstructured to allow individual center emphasis and specificity. A uniform set of data elements was defined and subsequently adopted by the AAPCC as the minimal data required by poison control centers seeking regional certifica-

tion. Standard definitions for each of these data elements and a reporting form were developed to ensure uniformity of data collection.

In 1982 the Food and Drug Administration offered a one-year fellowship to the chairman of the AAPCC Data Collection Committee to organize the developing data collection components into a functional system, develop the necessary software to collect and manipulate the data, develop a generic classification scheme, conduct and evaluate a two-month pilot test in nine regional poison control centers, and refine the system to make it available to poison control centers nationally in 1984.

The data collection system that evolved was based on a set of standardized, well-defined data elements, a comprehensive (90,000-item) product-specific seven-digit substance identification code (maintained by Micromedex, Inc., updated quarterly and published in Poisindex®), and an 800–900-item generic category code for use in data compilation and when product-specific trade name coding is not possible. A standardized report form, a key component of the system, is perforated vertically, separating into an 8.5" × 11" medical record and a 5.4" × 11" machine-readable data collection portion. The data collection portion is compatible with any National Computer System trans-optic scanner, which "reads" both sides simultaneously, extracting the raw data to magnetic tape, floppy disk, or mainframe computer via bisynchronous telecommunication. A machine readable litho-code on the data collection portion links this section to the same unique serial number on the medical record, thereby allowing subsequent retrieval of the entire medical record for more detailed research, surveillance, or hazard assessment. The medical record provides ample space for written comments and case documentation, and is completed by the poison information specialist at the time the call is received.

Nine poison centers participated in the pilot test of this system in January and February 1983, capturing

FIGURE 3. Distribution of poison center call volume by hour of the day and reason for exposure.

some 22,000 cases each month. Data were processed and tabulations returned to the centers within two weeks at  $\frac{1}{15}$  the cost of the FDA's previous system. Thus, without stressing the system, data were scanned and analyzed monthly so that no more than six weeks elapsed between the occurrence of a case and its inclusion in the database.

Extensive evaluations of the system were conducted, resulting in system revisions during the final quarter of 1983. As of January 1, 1984, 60 poison control centers are participating in a national data collection system, which expects to capture over 1,000,000 human poison exposures during 1984.

## SUMMARY OF 1983 POISON EXPOSURE DATA

Sixteen poison control centers participated in the data collection system for two to 12 months during 1983. (Seven centers contributed an entire year's data.) The 16 participating poison centers serve a total population of 43.1 million (based on 1983 official United States census projections), with each center reporting all poison exposure cases during the months the center participated in the data collection system. However, because of the temporal reporting variations, the data more closely approximate an annual service population of 25.8 million. Figure 1 displays the regions served for a portion of the year (lightly stippled) and for the entire year (cross-hatched). Noting the 234.0 million total United States population during this period, the data presented here represent an estimated 11.0% of the human poison exposures reported to poison control centers in the United States each year. Thus, the 251,012 human poison exposures reported in this database (Table 1) can be extrapolated to predict a nationwide incidence of human poison exposures in excess of 2.3 million. Further extrapolations from the frequency of reported poisonings to the frequency of total poisonings occurring in the United States each year cannot be made from these data alone, as considerable variations in poison center penetration were noted, with reported poisonings ranging from 3.0 to 17.8 per 1,000 persons per year. Furthermore, it is unlikely that even this higher figure reflects 100% reporting of all poisonings in the population

TABLE 7. Distribution of Reason for Exposure by Age, Human Exposure Cases Only

served, as a previous study in this region revealed only 65% of all poisonings were reported to that poison control center.<sup>1</sup>

The 251,012 human poison exposures reported to the AAPCC National Data Collection System in 1983 constitute the largest annual poison exposure database ever compiled in the United States. Although a smaller number of animal exposures and information calls were also reported (Table 1), this report focuses on the 251,012 human exposure cases, 90.8% of which occurred in the home (Table 2). Table 3 delineates the age and sex distribution of poison exposure victims, and emphasizes the predominance of children under 6 years of age (64%). In the younger age groups a somewhat greater proportion of males were involved in poisonings, but this gender pattern was clearly reversed in the teenage and adult exposures. Peak call volumes to poison control centers were noted at 10 to 11 AM and 5 to 7 PM, although call frequency remained consistently high between 9 AM and 10 PM, with 81% of calls logged during this 13-hour period (Fig. 2).

A single substance was implicated in 92.3% of cases, and only 2.1% of patients were exposed to more than two possibly poisonous drugs or products (Table 4). Most cases of human exposure were acute (98.6%), as were most poison-related fatalities (94.7%). (Chronic exposures were arbitrarily defined as repeated exposures to the same toxic substance or a single exposure lasting longer than eight hours.)

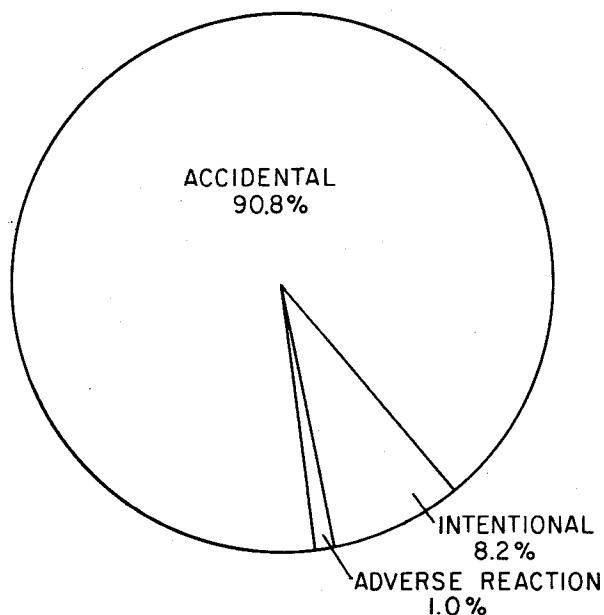

FIGURE 4. Reason for exposure.

The vast majority of exposures were accidental (90%); suicide attempts represented 5.4% of cases (Table 5). Whereas accidental poisonings outnumbered both intentional poisonings and adverse reactions in all age groups (Table 7), the difference was less profound in the teenage and adult cases. In contrast, of

TABLE 9. Distribution of Route of Exposure by Patient Management Site for Human Poison Exposure Cases

	Non-health Care Facility		Health Care Facility		Unknown Site		Total	
	No.	%	No.	%	No.	%	No.	%*
Ingestion	153,415	76.0	40,913	20.3	7,664	3.8	201,992	80.5
Inhalation	6,444	55.4	4,327	37.2	861	7.4	11,632	4.6
Ophthalmic	10,093	73.1	2,893	21.0	823	6.0	13,809	5.5
Dermal	11,328	75.1	2,968	19.7	788	5.2	15,084	6.0
Bites and stings	9,458	68.0	3,563	25.6	894	6.4	13,915	5.5

the 95 human poisoning fatalities reported, this ratio was reversed among the adult deaths, with four times as many deaths resulting from intentional as from accidental exposures (Table 8). The striking daytime predominance of accidental poisonings is not observed in the intentional exposures (Fig. 3).

Ingestions accounted for 80.5% of reported poison exposures (Table 9), followed in frequency by dermal, ophthalmic, bite and sting, inhalation, and parenteral routes. The 95 reported fatalities included 76 ingestions (80%), 11 inhalational exposures (11.6%), two parenteral exposures (2.1%), two envenomations (2.1%), two combined inhalation and ingestion exposures (2.1%), and in two patients, unknown routes of exposure (2.1%).

Table 6 shows the symptom assessment at the time of the initial call to the participating poison center. In addition to the 28.1% of patients with symptoms related to the poisoning at the time of the initial call, symptoms developed subsequently in 1,394 initially asymptomatic patients. Thus, overall, toxin-related symptoms developed in 28.7% of reported patients.

The majority of cases reported to poison centers were managed in a non-health care facility (72.7%), usually at the site of the exposure, the patient's own

home (Table 10). Treatment was rendered in a health care facility in 22.8% of patients, and of these, 48.6% were treated and released within four hours, 8.5% were treated and observed for more than four hours but not admitted, and 42.9% were admitted.

Table 11 compares medical outcome and reason for exposure, demonstrating the proportionally greater involvement of intentional exposures in cases with a major effect or fatality. Thirty-five per cent of patients had a minor effect (non-life-threatening symptoms followed the exposure, resolved within 24 hours, and resulted in no residual disability). A major effect was observed in 5.2% of cases (symptoms lasted more than 24 hours, were life-threatening, or resulted in disfigurement or residual disability). Ninety-five fatalities were documented and verified. Table 11 displays the medical outcome of the human poison exposure victims distributed by age, emphasizing the more severe outcome observed in the older age groups.

Table 14 outlines the use of initial decontamination procedures and specific antidotes in the treatment of the patients reported in this database. Ipecac syrup was administered in 13.4% of cases, more frequently outside a health care facility (especially in children, Table 13). (The reader is cautioned to interpret fre-

<i>Ficus benjamina</i> Weeping fig tree	151
<i>Solanum dulcamara</i> Climbing nightshade	149
<i>Toxicodendron radicans</i> Poison ivy	144
<i>Rhododendron</i> spp. Rhododendron, azalea	141
<i>Pittosporum tobira</i> Pittosporum	141
<i>Mahonia</i> spp. Oregon grape	138
<i>Quercus</i> spp. Oak	125
<i>Nerium oleander</i> Oleander	125
<i>Chrysanthemum</i> spp. Chrysanthemum	122
<i>Solanum pseudocapsicum</i> Jerusalem cherry	121
<i>Phoradendron flavescens</i> Mistletoe	121
<i>Begonia</i> spp. Begonia	119
<i>Sorbus</i> spp. Mountain-ash	111

cocaine (4), monoamine oxidase inhibitors (3), cardiac glycosides (3), iron (3), barbiturates (3), benzodiazepines (3), cyanide (3), ethylene glycol (3), hydrocarbons (2), and methanol (2). Tables 17 and 18 provide comprehensive demographic data on patient age, reason for exposure, medical outcome, and use of a health care facility for each category of poisonous substances. Table 17 focuses on non-pharmaceuticals; Table 18 focuses on drugs. A small percentage of cases involved exposure to multiple substances simultaneously, thus producing an occasional unexpected medical outcome that was probably related to the concomitantly ingested substance instead. (When interpreting Tables 17 and 18, note that the percentages of unknowns were deleted in the age, reason, and medical outcome categories; thus, the listed data total less than 100% for each category.)

TABLE 16. Summary of Fatal Exposures\*

Agent	Reason†	Exposure Type	Route of Exposure	Substance 1	Substance 2
Alcohols					
>17	int suicide	acute	ingestion	ethylene glycol	
>17	int suicide	acute	ingestion	acetaminophen	
>17	int suicide	acute	ingestion	acetaminophen and codeine	
>17	int suicide	acute	ingestion	theophylline	
>17	int suicide	acute	ingestion	phenelzine (MAOI)	
21	int abuse	acute	ingestion	ethanol	
27	int suicide	acute	ingestion	desipramine	
29	unknown	acute	ingestion	thioridazine	
30	int suicide	acute	ingestion	aspirin combination formulation	
34	int suicide	acute	ingestion	amitriptyline	
42	int suicide	acute	ingestion	benzodiazepines	
67	int suicide	acute	ingestion	ethylene glycol	isopropyl alcohol, 91%
Automotive/aircraft/boat products					
24	acc gen	acute	ingestion	octane booster (aniline oil + methanol)	
40	acc gen	acute	ingestion	octane booster (aniline oil + methanol)	
Bites and envenomations					
>17	acc gen	acute	bite/sting	brown recluse spider bite	
>17	acc gen	acute	bite/sting	rattlesnake	
Chemicals					
>17	int suicide	acute	ingestion	ethylene glycol	
>17	int suicide	acute	ingestion	ethylene glycol	
>17	int suicide	acute	ingestion	sulfuric acid	
>17	int suicide	acute	ingestion	sodium bichromate anticorrosive	
>17	int suicide	acute	ingestion	cyanide	
>17	acc gen	acute	inhalation	cyanide (smoke inhalation)	
>17	int suicide	acute	inhalation	cyanide	
32	acc occup	acute	inhalation	formaldehyde	
67	int suicide	acute	ingestion	ethylene glycol	
73	acc gen	acute	inhalation	iodine (inhaled fumes)	
Cleaning Substances					
9 mo	acc gen	acute	ingestion	pine oil disinfectant	
>17	int suicide	acute	ingestion	acid (tile cleaner)	
88	acc gen	acute	inhalation	liquid drain opener (acid)	
				laundry detergent	
Cosmetics/personal care products					
acc gen	acute	ingestion		denture cleanser powder (alkali)	

Fumes/gases/vapors									
18 mo	acc gen	acute	inhalation	carbon monoxide					
>17	int suicide	acute	inhalation	carbon monoxide					
>17	int suicide	acute	ing/inhal	carbon monoxide					
>17	int suicide	acute	inhalation	hydrogen sulfide					
28	acc gen	acute	inhalation	carbon monoxide (house fire)					
Heavy metals									
32	acc occup	acute	inhalation		formaldehyde				
Herbicides									
43	int suicide	acute	ingestion		paraquat				
Hydrocarbons									
30	acc misuse	chronic	inhalation						
58	acc gen	acute	ingestion						
Insecticides/pesticides									
<5	acc gen	acute	ingestion						
59	acc gen	acute	inhalation						
Analgesics									
8 mo	acc misuse	chronic							
17	int suicide	acute	ingestion	acetaminophen (pediatric formulation)					
>17	int suicide	acute	ingestion	acetaminophen					
>17	int suicide	acute	ingestion	acetaminophen					
>17	int suicide	acute	ingestion	amitriptyline					
>17	int suicide	acute	ingestion	aspirin (adult formulation)					
>17	int suicide	acute	ingestion	acetaminophen and codeine					
>17	adrx drug	acute	ingestion	acetaminophen					
>17	int suicide	acute	parenteral	acetaminophen					
>17	int suicide	acute	ingestion	pentazocine/aspirin					
>17	int suicide	acute	ingestion	acetaminophen and propoxyphene					
>17	int suicide	acute	ingestion	secobarbital					
>17	int suicide	acute	ingestion	acetaminophen					
>17	int suicide	acute	ingestion	acetaminophen, adult formulation					
>17	int misuse	acute	ingestion	hydrocodone/acetaminophen					
24	int suicide	acute	ingestion	salicylate					
30	int suicide	acute	ingestion	aspirin combination formulation					
33	int suicide	acute	ingestion	colchicine					
36	int suicide	acute	ingestion	thiordiazine					
44	int suicide	acute	ingestion	oxycodone/acetaminophen					
58	int suicide	acute	ingestion	acetaminophen

>17	int suicide	acute	ingestion	phenelzine (MAOI)	
>17	int suicide	acute	ingestion	doxepin	
19	int suicide	acute	ingestion	desipramine	
27	int suicide	acute	ingestion	amitriptyline	
34	int suicide	acute	ingestion	desipramine	
43	int suicide	acute	ingestion	amoxapine	
77	int suicide	acute	ingestion		
Antimicrobials				chloramphenicol (gray baby syndrome)	
3 mo	acc misuse	acute	parenteral		
22	int suicide	acute	ingestion	isoniazid	
Asthma therapies					
>17	int suicide	acute	ingestion	theophylline (long-acting)	
>17	int suicide	acute	ingestion	theophylline	
>17	int suicide	acute	ingestion	theophylline (long-acting)	
40	int suicide	acute	ingestion	theophylline	
Cardiovascular drugs					
>17	int suicide	acute	ingestion	reserpine	
>17	acc gen	chronic	ingestion	digoxin	
20	int suicide	acute	ingestion	disopyramide	
67	acc misuse	chronic	ingestion	digoxin	
76	int suicide	acute	ingestion	digoxin	
Cough and cold preparations					
2 mo	acc misuse	chronic	ingestion	pseudoephedrine	

Electrolytes/minerals				
16 mo	acc gen	acute	ingestion	iron
17 mo	acc gen	acute	ingestion	ferrous sulfate
17	int suicide	acute	ingestion	ferrous sulfate
Sedatives/hypnotics/antipsychotics				
>17	int suicide	acute	inghal	carbon monoxide
>17	int suicide	acute	ingestion	sodium butabarbital
>17	int suicide	acute	ingestion	phenelzine (MAOI)
>17	int suicide	acute	ingestion	barbiturates
>17	int suicide	acute	ingestion	secobarbital
29	unknown	acute	ingestion	thioridazine
35	int suicide	acute	ingestion	thioridazine
36	int suicide	acute	ingestion	thioridazine
42	int suicide	acute	ingestion	benzodiazepines
44	int suicide	acute	ingestion	oxycodone/acetaminophen
77	int suicide	acute	ingestion	amoxyapine
Stimulants and street drugs				
13-17	int abuse	acute	unknown	cocaine
>17	int abuse	acute	ingestion	cocaine
>17	int suicide	acute	ingestion	amoxyapine
>17	int misuse	acute	ingestion	caffeine and phenylpropanolamine look-alike
>17	int suicide	acute	inghal	marijuana
>17	int misuse	acute	ingestion	unknown street drugs ("speed")
>17	int abuse	acute	unknown	cocaine
Topical agent				
1.5	acc gen	acute	ingestion	oil of wintergreen
Unknown drug				
>17	int suicide	acute	ingestion	unknown drugs

\* Cases are listed twice if more than one substance was involved in exposure.

† Age in years unless otherwise indicated; specific age provided where known.

‡ Reason for exposure may be either accidental/general (acc gen), accidental/misuse (acc misuse), accidental/occupational (acc occup), intentional/suicide (int suicide), intentional/misuse (int misuse), intentional/abuse (int abuse), or adverse reaction to a drug (adrx drug).

TABLE 17. Demographic Profile of Exposure Cases by Generic Category of Substances and Products: Non-pharmaceuticals

	No. of Exposures	Age (Years)			Reason			Treated in Health Facility (%)			Medical Outcome (Effect)
