    I just hate those hooded sweat shirts, don’t you? They hide faces so well. Wonder did this person have the hood on the whole time he/she was a patron. And did NO ONE know who said hoodie was? Remarkable to me that a shot rang out and then this hooded […]

    Does this mean that I get charged extra for what doesn’t fit in the container? For example furniture.

Toy recall, report signals small-battery dangers

LINDSEY TANNER, AP Medical Writer

CHICAGO — Swallowing button batteries can be fatal or cause serious harm, and research suggests that severe injuries in children, though relatively scarce, are on the rise.

The dangers are highlighted in a new medical report about 10 cases at a Utah hospital, including seven that caused severe damage, and in last week’s recall of more than 1 million Chuck E. Cheese battery-containing toys. There are no reports of children injured by the Chuck E. Cheese toys, but the toys were recalled because swallowing batteries can be so dangerous.

Button batteries are widely used in dozens of household products including toys, games, remote controls, musical greeting cards, cell phones, watches and lighted shoes. Batteries pose a special swallowing risk; even if they don’t completely block the throat, they can trigger a chemical process when they lodge there that can burn through tissue within just a few hours.

“These are bad news. They have to be removed immediately,” said Dr. Fuad Baroody, a pediatric ear, nose and throat specialist at the University of Chicago. Baroody said his hospital treats about two to three children each year with battery-related injuries.

In the throat, “the window for safely removing batteries is only two hours,” said Dr. Toby Litovitz, director of the National Capital Poison Center.

When surrounded by moist tissue, batteries can create an electrical current that combines with body fluids to form a caustic lye-like chemical, she explained.

Aidan Truett, a 13-month-old boy in Hamilton, Ohio, died last November when a dime-sized battery burned through his esophagus and burst his aorta.

No one saw him swallow the battery but his parents took him to the doctor when he began spitting up. Doctors suspected a stomach problem; several days later an X-ray revealed the battery in his throat, his father, Lonnie Truett, recalled.

Doctors surgically removed the battery and sent Aidan home, but he died a few days later when his aorta burst, Truett said.

“Aidan,” Truett said. Parents need to be aware, he said, and keep objects containing button batteries “behind lock and key.”

The Archives of Otolaryngology published a report Monday from doctors at Primary Children’s Medical Center in Salt Lake City about 10 cases treated there between 1998 and 2008. All were babies and young children; many required major surgery.

“Their youngest case was just over a year old,” said Dr. Albert Park, a report co-author and a head and neck specialist at the hospital. “This is a very much under-appreciated problem, and the severity of these conditions is under-appreciated.”

Every year more than 3,500 people swallow button or disc-shaped batteries, according to Litovitz’s center, an independent group affiliated with George Washington University Medical Center in Washington, D.C.

Lithium cell batteries at least 20 millimeters in diameter, a little bigger than a penny, are the riskiest. They’ve become commonplace because they’re lighter and more powerful than older-model batteries, Litovitz said. They’re also more likely than older models to lodge in young children’s throats and cause damage, and have been implicated in at least six of 10 deaths since 2003 reported to the center.
Of 80 severe cases reported to the center since the 1970s, 42 occurred since 2004. Ten of 14 deaths reported since 1977 occurred within the past six years, Litovitz said. She said many cases likely go unreported. Her center operates a 24-hour hot line offering advice when battery ingestion is suspected.
